
CDuce

Alain Frisch

Joint work with: Véronique Benzaken, Giuseppe Castagna

<http://www.cduce.org/>

Programming with XML

- Level 0: textual representation of XML documents
 - AWK, sed, Perl
- Level 1: abstract view provided by a parser
 - SAX, DOM, ...
- Level 2: untyped XML-specific languages
 - XSLT, XPath
- Level 3: XML types taken seriously (aka: related work)
 - XDuce, Xtatic
 - XQuery
 - ...

CDuce:

- XML-oriented
- type-centric
- general-purpose features
- efficient (faster than XSLT at least !)

Intended uses:

- Small “adapters” between different XML applications
- Larger applications
- Web applications, web services

Status of the implementation

- Public release available for download (+ online web prototype to play with).
- JIT compilation of pattern matching.
- Quite efficient, but many more optimizations are possible (and considered).
- Integration with standards:
 - Unicode, XML, Namespaces: fully supported.
 - DTD: external `dt2cduce` tool.
 - XML Schema: being implemented at a deeper level.

Summary of the talk

- Introduction
- XML in CDuce: document and types
- Types
- Pattern matching
- Functions
- Type errors
- Ongoing work. Around CDuce

XML-oriented + data-centric

- XML literals : in the syntax.
- XML fragments : first-class citizens, not embedded in objects.

```
<program>[  
  <date day="monday">[  
    <invited>[ <title>[ 'Conservation of information' ]  
              <author>[ 'Thomas Knight, Jr.' ] ] ]  
    <talk>[ <title>[ 'Scripting the type-inference process' ]  
           <author>[ 'Bastiaan Heeren' ]  
           <author>[ 'Jurriaan Hage' ]  
           <author>[ 'Doaitse Swierstra' ] ] ] ] ]
```

Types are pervasive in CDuce:

- Static validation
 - E.g.: does the transformation produce valid XHTML ?
- Type-driven semantics
 - Dynamic dispatch
 - Overloaded functions
- Type-driven compilation
 - Optimizations made possible by static types
 - Avoids unnecessary and redundant tests at runtime
 - Allows a more declarative style

$$\vdash v : t$$

$v ==$

```

$t ==$

Program

```
type Program = <program>[ Day* ]  
type Day = <date day=String>[ Invited? Talk+ ]  
type Invited = <invited>[ Title Author+ ]  
type Talk = <talk>[ Title Author+ ]  
type Author = <author>[ PCDATA ]  
type Title = <title>[ PCDATA ]
```

- Types describe values.
- A natural notion of subtyping:

$$t \leq s \iff \llbracket t \rrbracket \subseteq \llbracket s \rrbracket$$

where

$$\llbracket t \rrbracket = \{v \mid \vdash v : t\}$$

- Problem: circular definition between subtyping and typing!
 - Bootstrap method to remain set-theoretic.
- Problem: implementation of the complex subtyping relation.
 - hand-made lightweight solver
(\rightsquigarrow **remove backtracking** from XDuce algorithm)
 - caching, set-theoretic heuristics

Pattern Matching: ML-like flavor

- ML-like flavor:

```
match e with <date day=d>_ -> d
```

```
type E = <add>[Int Int] | <sub>[Int Int]
fun eval (E -> Int)
  | <add>[ x y ] -> x + y
  | <sub>[ x y ] -> x - y
```

- Patterns are “types with capture variables”
- The type system:
 - Ensures exhaustivity.
 - Infers precise types for capture variables.

Pattern Matching: beyond ML

- Type-based dispatch:

```
match e with  
| x & Int -> ...  
| x & Char -> ...
```

```
let doc =  
  match (load_xml "doc.xml") with  
  | x & DocType -> x  
  | _ -> raise "Invalid input !";;
```

Pattern Matching: beyond ML

- Regular expression and capture:

```
fun (Invited|Talk -> [Author+]) <_>[ Title x::Author* ] -> x
```

```
fun ([ (Invited|Talk|Event)* ] -> ([Invited*], [Talk*]))  
  [ (i::Invited | t::Talk | _) * ] -> (i,t)
```

```
fun parse_email (String -> (String,String))  
  | [ local::_* '@' domain::_* ] -> (local,domain)  
  | _ -> raise "Invalid email address"
```

Compilation of pattern matching

- **Problem:** implementation of pattern matching
- **Result:** A new kind of push-down tree automata.
 - ↪ Non-backtracking implementation
 - ↪ Uses **static type information**
 - ↪ Allows a more **declarative style**.

```
type A = <a>[ Int* ]  
type B = <b>[ Char* ]
```

```
fun ([A+|B+] -> Int) [A+] -> 0 | [B+] -> 1
```

≈

```
fun ([A+|B+] -> Int) [ <a>_ _* ] -> 0 | _ -> 1
```

- **TODO:** formalize and prove optimality properties.

- Overloaded, first-class, subtyping, name sharing, code sharing...

```
type Program = <program>[ Day* ]
type Day = <date day=String>[ Invited? Talk+ ]
type Invited = <invited>[ Title Author+ ]
type Talk = <talk>[ Title Author+ ]

let patch_program
  (p :[Program], f :(Invited -> Invited) & (Talk -> Talk)):[Program] =
  xtransform p with (Invited | Talk) & x -> [ (f x) ]

let first_author ([Program] -> [Program];
                 Invited -> Invited;
                 Talk -> Talk)
| [ Program ] & p -> patch_program (p,first_author)
| <invited>[ t a *_ ] -> <invited>[ t a ]
| <talk>[ t a *_ ] -> <talk>[ t a ]

(* we can replace the last two branches with:
   <(k)>[ t a *_ ] -> <(k)>[ t a ]
*)
```

Precise type errors

```
type Title = <title>String
type Author = <author>String
type Talk = <talk>[ Title Author+ ]
```

```
let x : Talk = <talk>[ <author>[ 'Alain Frisch' ] <title>[ 'CDuce' ] ]
```

~>

```
let x : Talk = <talk>[ <author>[ 'Alain Frisch' ] <title>[ 'CDuce' ] ]
```

This expression should have type:

`title

but its inferred type is:

`author

which is not a subtype, as shown by the sample:

`author

Precise type errors

```
type Title = <title>String
type Author = <author>String
type Talk = <talk>[ Title Author+ ]
```

```
fun mk_talk(s : String) : Talk = <talk>[ <title>s ]
```

~>

```
fun mk_talk(s : String) : Talk = <talk>[ <title>s ]
```

This expression should have type:

```
[ Author+ ]
```

but its inferred type is:

```
[ ]
```

which is not a subtype, as shown by the sample:

```
[ ]
```

Precise type errors

```
type Title = <title>String
type Author = <author>String
type Talk = <talk>[ Title Author+ ]
type Invited = <invited>[ Title Author+ ]
type Day = <date>[ Invited? Talk+ ]
```

```
fun (Day -> [Talk+]) <date>[ _ x::_* ] -> x
```

~>

```
fun (Day -> [Talk+]) <date>[ _ x::_* ] -> x
```

This expression should have type:

```
[ Talk+ ]
```

but its inferred type is:

```
[ Talk* ]
```

which is not a subtype, as shown by the sample:

```
[ ]
```

Precise type errors

```
type Program = <program>[ Day* ]
type Day = <date day=String>[ Invited? Talk+ ]
type Invited = <invited>[ Title Author+ ]
type Talk = <talk>[ Title Author+ ]
type Author = <author>[ PCDATA ]
type Title = <title>[ PCDATA ]
```

```
fun (p : [Program]) : [Program] = xtransform p with Invited -> []
```

```
fun (p : [Program]) : [Program] = xtransform p with <invited>c -> [<talk>c]
```

```
fun (p : [Program]) : [Program] = xtransform p with Talk -> []
```

~>

```
fun (p : [Program]) : [Program] = xtransform p with Talk -> []
```

This expression should have type:

```
[ Program ]
```

but its inferred type is:

```
[ <program>[ <date day = String>[ Invited? ]* ] ]
```

which is not a subtype, as shown by the sample:

```
[ <program>[ <date day = ">[ ] ] ]
```

Other features

- General-purpose: records, tuples, integers, exceptions, references, . . .
- String + regular expressions (types/patterns)
- Boolean connectives (types/patterns)
- Other iterators

Ongoing work on language design

Currently investigated:

- XSLT/XPath/XQuery-like primitives
- Support for XML Schema.
- Interface with external languages.
- Module system, incremental programming.
- Parametric polymorphism.

Around CDuce

- Dynamic web applications (S. Zacchioli)
- Query language (C. Miachon)
- Security & information flow analysis (M. Burelle)

Thank you !
